FINAL REPORT

The Future of Diverse and Disadvantaged Neighborhoods in the Nordic Welfare States: The Voices of Residents

Project duration

July 1, 2022–June 30, 2026

Project leaders

Peter Esaiasson, Professor, Department of Political Science, University of Gothenburg (until June 30, 2025

Jacob Sohlberg, Associate Professor, Department of Political Science, University of Gothenburg (until the end of the project)

Participating researchers

Henning Finseraas, Professor, Department of Political Science, Norwegian University of Science and Technology (Co-PI, Norway) (48 months, part-time); Niels Nyholt, Postdoc, Department of Political Science, Aarhus University (36 months, part-time); Oskar Rönnberg, Doctoral Researcher, Department of Geosciences and Geography, University of Helsinki (48 months); Jacob Sohlberg, Associate Professor, Department of Political Science, University of Gothenburg (48 months, part-time); Mathew Page, project coordinator, Department of Geosciences and Geography, University of Helsinki (left the project); Kim Mannemar Sønderskov, Professor, Department of Political Science, Aarhus University (Co-PI, Denmark) (48 months, part-time); Mari Vaattovaara, Professor, Department of Geosciences and Geography, University of Helsinki (Co-PI, Finland) (48 months, part-time)

Research assistants

Lærke Kahns Kristensen, Student assistant, Department of Political Science, Aarhus University (18 months); Julie Nue Mikkelsen, Student assistant, Department of Political Science, Aarhus University (18 months); Niko Pelkonen, project coordinator, Department of Geosciences and Geography, University of Helsinki (24 months)

The aim and purpose of the project

The project delivered its central empirical objective: collecting residents' perspectives on life in diverse and disadvantaged Nordic neighborhoods and establishing a common basis for comparative research. Implementation followed the application's two main phases of coordinated data collection and subsequent analysis, with communication to residents, researchers and decision-makers taking place throughout.

Before implementation, the project was adjusted to accommodate a grant that was 15 percent lower than requested. With the funder's agreement, data collection was concentrated in Denmark, Finland and Sweden, while the Norwegian team remained involved in the comparative research. This preserved the core Nordic design within the available resources. The revised application also redistributed responsibilities following a personnel change and postponed the project's start to July 1, 2022.

Preparatory work involved developing common questionnaires, arranging translations, recruiting and training enumerators, and establishing local contacts. The surveys were conducted in Gellerup/Toveshøj and Herredsvang in Aarhus, Kontula and Koivukylä in the Helsinki metropolitan area, and Biskopsgården and Hammarkullen in Gothenburg. Herredsvang and Koivukylä replaced Langkærparken and Meri-Rastila in the application's preliminary list, consistent with its provision for adjustments to the final selection.

Initial neighborhood fieldwork took place between May and November 2023 and produced 4,730 interviews with residents of the six core study areas, exceeding the application's target of 3,600 across the three countries. The central ambition of reaching residents who are frequently underrepresented in conventional surveys guided implementation. Recruitment combined residential visits with approaches in public spaces and community settings. Interviews were available in seven languages, and participants could answer independently on a tablet or receive assistance from an enumerator.

Recruitment procedures were adapted to local circumstances. The planned uniform visiting procedure varied according to access to residential buildings and opportunities to contact residents. Outreach in public spaces complemented residential recruitment, while flexible interviewing hours and advance information helped lower participation barriers. Incentives also reflected national requirements: in Finland, gift-card draws replaced guaranteed payments because of tax regulations.

The online follow-up was conducted in two rounds, during October–November 2023 and January–February 2024, coordinated by the Laboratory of Opinion Research at the University of Gothenburg. Despite incentives, electronic reminders and telephone follow-up, it obtained 1,087 responses from core-area residents against the application's target of 1,800. This shortfall limited the scope for some analyses of individual neighborhoods, although the follow-up provided material for comparative analyses and survey experiments.

The principal deviation from the revised timetable arose from unexpected difficulties with the Swedish Ethical Review Authority. Approval was subsequently obtained from the Swedish Ethics Appeals Board. An approved twelve-month extension moved the project's end date from June 30, 2025 to June 30, 2026, allowing additional time for analysis and publication. Regular digital meetings and meetings in person supported coordination across the national teams.

A substantive addition to the original design was the commissioning of national benchmark surveys in Denmark, Finland and Sweden. Whereas the application proposed comparisons

using existing national surveys, the project collected its own benchmark data through an external provider in June 2024, obtaining 3,077 responses. This addition was financed through a reprioritization of the budget and strengthened comparisons between neighborhood residents and the wider population.

The methodological ambition to develop guidance for surveying populations that are difficult to reach resulted in an open-access article in *Sociological Methods & Research*. The survey data and comprehensive documentation are freely available through the *Open Science Framework*. Public release occurred later than the fall 2024 milestone envisaged in the application. Preparing the public dataset included omitting or recoding variables to protect respondents' anonymity, addressing the data-sharing challenge identified in the interim report.

Scientific publication followed the planned progression from conference and workshop presentations to journal submissions. The publication plan presented approximately eight articles as a tentative ambition, dependent on the findings, while explicitly prioritizing substantial contributions, quality and scientific impact. The central ambition of publishing in high-impact international journals was achieved, with open-access articles in *Sociological Methods & Research*, *Political Geography* and *Journal of Environmental Psychology*. More broadly, the project's publications span political science, urban geography, sociology and psychology. This disciplinary breadth is a significant achievement, bringing residents' perspectives and the project's methodological contributions into several distinct scientific debates.

A further peer-reviewed article by Rönnberg, Pelkonen and Vaattovaara (2025), published in Finnish in *Yhteiskuntapolitiikka*, examines trust, neighborhood satisfaction and perceived problems among residents of the Finnish study areas. The project also produced a doctoral dissertation, four student theses and a book chapter, contributing to both scientific knowledge and research training. Three further manuscripts are under review and two are in preparation, extending the scientific output beyond the funded period.

Communication was integrated into implementation. Findings were presented and discussed with residents in all six neighborhoods during 2023–2024, fulfilling the commitment to report back to participating communities. Further dissemination included academic conferences, public presentations, newspaper opinion pieces, and meetings with public authorities, housing organizations and political representatives. These activities advanced the application's objective of bringing residents' perspectives into scientific discussion and public debate.

Scientific impact

The project's three most significant contributions concern the methodology for studying vulnerable neighborhoods, the identification of residents' experiences of vulnerability, and the discovery of common patterns across Nordic countries.

First, we demonstrated the feasibility of collecting inclusive, comparative survey evidence from populations that conventional surveys frequently struggle to reach. Conducting the surveys required overcoming substantial barriers to contact, recruitment and participation. The combination of intensive local fieldwork, multilingual questionnaires, flexible interviewing procedures and national comparison samples established a new empirical basis for studying residents' perspectives across three Nordic welfare states. This methodological contribution was published in *Sociological Methods & Research*. The freely available data and comprehensive documentation constitute a lasting research resource, enabling replication, further analysis and the application of the approach in other settings.

Second, we showed that everyday social disorder is a substantial concern, while identifying important similarities between neighborhood residents and the wider population. Residents reported considerably greater problems with disorder, including littering and disruptive behavior, than respondents in the national comparison samples. Experiences of unfair treatment also emerged as a particularly pronounced dimension of vulnerability. Differences in institutional trust and national identification were generally smaller. The findings therefore provide a more precise account of vulnerability; unequal experiences of everyday neighborhood conditions and treatment coexist with substantial similarities in other domains. This directs scientific attention toward the conditions under which residents live and interact with institutions, while challenging broad assumptions about their separation from the wider society.

Third, we established a common pattern of neighborhood experiences across national borders. The analyses published in *Political Geography* showed that the six vulnerable neighborhoods resembled one another more closely in their neighborhood perceptions than they resembled their respective national populations. This answers a central question motivating the Nordic comparative design: whether vulnerable neighborhoods primarily reflect their national settings or share experiences across countries. The findings support the existence of a common pattern across the studied neighborhoods, alongside national and local variation. They provide an empirical basis for studying vulnerability as a shared phenomenon within Nordic welfare states and demonstrate the scientific value of coordinated cross-country research.

The project also made an explanatory contribution through the study published in *Journal of Environmental Psychology*. Across three studies, dirty waste-disposal environments increased improper disposal, while greater disgust sensitivity was generally associated with lower compliance. These findings point to an affective pathway through which social disorder can reproduce itself: unpleasant environments can encourage avoidance and make appropriate disposal less likely. Maintaining clean shared spaces may consequently support cooperative behavior.

Additional explanatory contributions are currently under review or in preparation. The manuscripts under review examine trust in local schools and residential mobility, explanations of the integration paradox, and residents' proposals for improving their neighborhoods. Work

in preparation investigates the conditions shaping tolerance of anti-religious expression and how survey techniques influence conclusions about immigrant populations. Together, these studies broaden the project's investigation of social cohesion, institutional relationships and inclusion.

The project has generated two new lines of research. The first asks how social order is created and sustained, with particular attention to institutional monitoring. Public housing providers' introduction of cameras in shared waste facilities creates an opportunity to investigate whether monitoring improves behavior through deterrence, strengthens voluntary cooperation, or undermines cooperation when residents experience suspicion or unfair treatment. These questions have been developed into new funding applications combining administrative records, resident surveys and experiments. The emerging research examines behavioral improvements together with trust, legitimacy and the durability of cooperation.

The second line concerns who governs social order within a strong welfare state. A larger research program under development will map how public institutions, housing providers, civic organizations and informal actors set expectations, resolve disputes and organize collective contributions. It brings questions about competing and overlapping authorities, familiar from development research, into the Swedish welfare-state context. Comparisons between contrasting localities will investigate how actors reinforce, substitute for or compete with one another, and how these arrangements affect everyday coordination and cooperation. This program is being developed together with comparative scholars.

Societal impact

The project has advanced societal impact by bringing residents' perspectives into public debate, policy discussions and the work of organizations responsible for neighborhood conditions. It has also contributed to a prominent national debate about research ethics and the conditions for inclusive social research. These contributions fulfil the application's central societal ambition: to give residents who are seldom heard a collective voice and make their experiences available to decision-makers and the wider public.

Engagement with residents and local stakeholders formed part of the research throughout. Findings were presented and discussed in all six participating neighborhoods during 2023–2024: Hammarkullen and Biskopsgården in Sweden, Gellerup and Herredsvang in Denmark, and Kontula and Koivukylä in Finland. These meetings fulfilled our commitment to report back to the communities contributing to the research and provided opportunities to discuss the findings in their local context. In Finland, the team also presented preliminary results to Helsinki's Urban Research and Statistics Unit in May 2024 and engaged with Vantaa's segregation network in June 2024, City of Helsinki Urban Environment Division in February 2025, Helsinki Region Urban Renewal Network in March 2025, and City of Helsinki Education Division in May 2025. The project's public blog made findings and information about the research accessible to residents.

Our dialogue with policymakers extended across local, regional and national levels. Engagement began during preparations for the surveys and continued as findings became available. Concrete contacts included a meeting with the Swedish Prime Minister in April 2023, the Riksdag's Committee on Civil Affairs in June 2023, and the Swedish National Council for Crime Prevention in November 2023. Further exchanges involved Stockholm municipal

politicians and networks of politicians and senior administrators in Östergötland during 2024. We also engaged with several political parties, including the Moderate Party's election-planning group in April 2025, the Social Democratic Party Congress in June 2025, and the Stockholm Social Democratic leadership in March 2026, alongside Center Party youth and student organizations. This sustained engagement brought research on residents' experiences into forums where housing, integration and neighborhood policies are discussed.

Housing organizations and professional audiences were another important route to impact. Activities included the Gothenburg Public Housing Research Network in August 2024, Örebrobostäder in December 2024, and the Gothenburg Public Housing Board in November 2025. Presentations at Business Arena in Stockholm and Helsinki reached housing-sector audiences. Repeated lectures at the police training institution in Borås during 2023–2025 brought residents' perspectives into professional education, while engagement with Vivallaskolan in Örebro connected the research with a local school. Discussions with Statistics Sweden's survey specialists in February 2025 addressed how residents who are difficult to reach can be included in the evidence used by public institutions.

Public debate was a central component of our engagement. Peter Esaiasson and Jacob Sohlberg used public articles and presentations to challenge established assumptions about vulnerable neighborhoods and draw attention to residents' own priorities. Their contribution to *Tiden* in December 2024 addressed residents' support for a broad range of improvements, including public investment and greater everyday social responsibility. Presentations at the Gothenburg Book Fair in 2023 and 2025 brought these questions to wider audiences. In Finland, Mari Vaattovaara used the project's comparative findings in a December 2025 Yle interview to challenge the continuing assumption that Finland had been particularly successful in preventing segregation. She highlighted the comparatively pessimistic assessments of neighborhood development among Finnish respondents. These interventions placed residents' evidence directly into contested public discussions. The project's results and survey method were broadly covered in Finnish main news outlets after the publication of a peer-review research article focusing on the Finnish results in *Yhteiskuntapolitiikka* journal and the doctoral dissertation of project researcher Oskar Rönnberg.

An important additional impact arose from our public challenge to the Swedish ethical-review process. Esaiasson and Sohlberg's account of the refusal to approve the neighborhood surveys brought the consequences for inclusive social research into national debate and elicited a public response from the authority. Our case became a concrete example in the wider discussion of proportionality, academic freedom and the risk that important populations and questions would remain unstudied. The broader mobilization included a petition signed by approximately 2,500 researchers, acknowledged by the education minister when announcing a review in May 2023. The subsequent reform process culminated in Parliament's adoption of changes to the ethical-review legislation on June 17, 2026, scheduled to take effect on July 1, 2027. Our contribution to this wider process connected research regulation with the democratic importance of allowing residents' experiences to enter public knowledge.

A further visible effect is the practical reuse of the project's survey approach. It has already been applied in additional resident surveys connected with public housing providers in Gothenburg and Malmö, and the city of Helsinki has shown great interest in learning about the method for developing their data collection methods in the future. This extends the project's

contribution from communicating findings to improving organizations' capacity to obtain residents' perspectives. Public engagement has also continued beyond the funded period, including the research team's joint *Svenska Dagbladet* article on October 4, 2026, calling for residents' experiences to inform responses to housing segregation.

In the short term, municipalities and housing providers can use the findings to identify residents' priorities, improve consultation and assess the management of shared spaces. The waste-disposal research provides evidence for maintaining clean facilities, while the emerging research on monitoring will examine improvements in behavior alongside fairness and trust. Over the longer term, the open data, documented methods and established organizational relationships support more inclusive consultation and continued evaluation of neighborhood interventions. The project has thus created several durable routes to impact: stronger representation of residents in public knowledge, sustained dialogue with decision-makers, practical use of its methods, and a contribution to reform of the conditions under which such research can be conducted.

Summary for communication purposes

1. **Which current societal challenges has your research project addressed?**

The project addressed residential segregation, unequal living conditions and the exclusion of residents' voices from debates about diverse and disadvantaged Nordic neighborhoods. It examined everyday social disorder, including littering and disruptive behavior, and residents' experiences of unfair treatment. By asking residents directly and comparing their views across Denmark, Finland and Sweden, the research brought evidence into discussions often shaped by assumptions. Engagement with residents, municipalities, housing providers and policymakers strengthened public dialogue. The project also helped bring barriers to inclusive social research into the Swedish debate on research ethics.

2. **What are your main scientific results (1–3)?**

1) We developed an inclusive approach to surveying residents who conventional surveys often miss, and released the data and detailed documentation for others to use. 2) Residents reported substantially more everyday disorder and unfair treatment than the wider population, while differences in trust in institutions and national belonging were generally smaller. 3) The six study areas resembled one another more closely in their neighborhood perceptions than the wider populations in their own countries. These findings provide a more precise account of vulnerability and a shared basis for Nordic research. The work spans political science, urban geography, sociology and psychology.

3. **How can the results be used in the future and by whom**

The similarities across the studied neighborhoods strengthen the case for Nordic cooperation on segregation. Policymakers can learn from one another and test responses to shared problems of everyday disorder and unfair treatment. This requires evidence that includes residents' own perspectives. Survey organizations can use our documented methods to reach groups conventional surveys often miss, while academics can build on the open data and practical blueprint to study hard-to-survey populations across countries. The approach also provides a foundation for research beyond the Nordic region, where it remains an open question whether similar patterns emerge under different welfare and housing systems.

Feedback to the financers

We experienced strong support from SLS throughout the project. Communication was straightforward, accessible and constructive, which was particularly valuable as we navigated the practical challenges of a demanding international research project. The program seminars in Helsinki, Uppsala and again in Helsinki were excellent opportunities to discuss research, exchange experiences and meet colleagues working on other projects.

The Nordic focus was a particular strength for our project. We had long been concerned with whether the conditions observed in Sweden's vulnerable neighborhoods were specific to Sweden or reflected experiences shared across Nordic countries. The program enabled us to address this question through a coordinated comparative design. This perspective was integral to our research from the outset and contributed directly to some of our most significant findings.

Our main recommendation for future programs is therefore to continue emphasizing the scientific rationale for Nordic comparison. Applicants should explain how comparison shapes their research questions, selection of cases and interpretation of findings. A Nordic framework is most productive when it creates analytical opportunities that are central to the research. Without this foundation, the geographical requirement could become difficult to integrate meaningfully. Clear expectations at the application stage would help ensure that participating countries contribute to a coherent scientific design.

Social order is fundamental to all societies. In the Nordic countries, high levels of trust are a particular strength, supporting everyday cooperation and the functioning of public institutions. The challenges in vulnerable neighborhoods underline the need to understand how social order can be created and maintained while sustaining this trust. Future Nordic programs should examine these processes across diverse social and geographical contexts, comparing the roles of public institutions, housing providers, civic organizations and residents.

Speaking personally (Jacob Sohlberg), this project has enabled some of the strongest research of my career. SLS's support, the Nordic comparative framework and the opportunity for sustained collaboration have been central to that experience.
